## OPERATING INSTRUCTIONS FOR MODEL 213 OR 215

### GENERAL

MODEL 211 or 213 is a compact, completely flexible tube checker. It is normally designed for 105-130 volt AC 60 cycle operation.

It uses an NE2 neon bulb for a "short" indicator.

All slide switches at the bottom of the panel should normally be kept in "K" position.

The N-S slide switch is normally kept in the "N" position unless the tube chart indicates otherwise.

## 11. SHORT TEST

1. Set "SHORT-QUALITY" switch to "SHORT" position.
2. Press the slide switches up, one at a time to "P" position, and return them to "K" position.
3. The slide switch corresponding to the number in the "FILAMENT SELECTOR" column is not touched but is left in the "K" position. For example, on the 1S5 tube, slide switch #1 is kept in the "K" position at all times.
4. Unless the tube chart indicates otherwise, it is normal for the neon lamp to glow when only one of the slide switches is pressed to "P" position. This simply indicates filament or heater continuity. However, unless the tube chart indicates otherwise, if the neon lamp glows when more than one slide switch is pressed to "P" position, the tube is defective and should be discarded without further test. A momentary flash of the neon bulb should be disregarded.
5. A shorted tube should not be checked for quality since it might overload the meter or transformer.
6. Tubes having a filament or heater voltage of 18 volts or higher sometimes show a steady leakage at the rated heater voltage, although they are satisfactory to use. In such cases reduce the "FILAMENT VOLTS" switch by 1 position. If the glow still persists at the reduced heater voltage, the heater is actually defective. If it dies down at the lower voltage, disregard the glow, reset the "FILAMENT VOLTS" switch to the rated value, and continue with the quality test.
7. Tubes with a filament or heater voltage of 50V or higher must be checked for shorts with the "FILAMENT VOLTS" switch at position "d". After the short test, the "FILAMENT VOLTS" switch is set to the position indicated

on the tube chart and the tube checked for quality.

### III.

#### QUALITY TEST

1. Make sure that the "SHUNT" control is correctly set to the value indicated on the tube chart and set "SHORT-QUALITY" switch to "QUALITY" position.
2. Press the switch or switches in the "P" column to "P" position.
3. Allow about 1/2 minute or so for the tube to heat up. Power tubes require more time to heat up.
4. Read the tube quality on the "REJECT-GOOD" scale. If the meter doesn't move, try tapping the meter lightly with a finger before rejecting the tube. If the tube chart says "OK" over diode" in the "Notation" column, the pointer need go only past the "Diodes OK" mark (about 3 meter divisions) to be considered good.
5. If the tube has more than one section, return all the switches in the "P" position to the "K" position after completing the test on one section. Then reset the switches and shunt control for the other section or sections.

#### NOTE: -

If a tube starting with 4 such as 4EJ7 for example is not listed, look under 6EJ7 and use identical settings for testing it except that the short test should be done at "c" instead of "d".

If a tube starting with 10,12,13, or 15 such as 13Z10 for example is not listed, look under 6Z10 and use identical settings for testing it except that the Filament Volts switch is set at "e" instead of "d".

IV. VOLTAGE REGULATOR TUBES, VR75, VR90, VR105 and VR150

1. Set "SHORT-QUALITY" switch to "QUALITY" Position.
2. Set "SHUNT" control to "O" position.
3. Press #2 and #10 switches to "P" position.
4. If tube is good, it will glow.

GUARANTEE

This instrument is guaranteed for 90 days from date of purchase to be free from any defect in workmanship or material. ELECTRONIC MEASUREMENTS CORPORATION will replace any defective part or parts within this period without charge, if tests at our factory show that the defect was not caused by abuse or tampering.

ELECTRONIC MEASUREMENTS CORPORATION reserves the right to make changes in design or add improvements to equipment manufactured by them without incurring any obligation to incorporate such changes or improvements in equipment previously sold by them.

N-S Switch is kept in N Position unless tube chart indicates otherwise
